

Fence Line Monitoring Data

August 2021

The below chart shows the average monthly H<sub>2</sub>S readings taken from 8 locations around the Gold Bar fence line. The readings that we take at these stations are spot readings – instantaneous captures of air samples. The air conditions captured in these samples may only exist for a moment in time.

August 2021:

- We were able to capture 248 spot readings, taken across each of the 8 stations
- The average spot reading in August overall was 1.86 ppb
- The highest spot reading at any location in August was 68 ppb
  - High readings were from fugitive emissions from diversion structure project that had been opened up for maintenance access. Gaps in access hatches were immediately sealed up and odours were contained.

Notes:

- Samples can only be taken if the temperature is above roughly -10° Celsius as the equipment does not capture accurate readings in cold weather
